

Telehandler Certification Glendale

Telehandler Certification Glendale - Telehandler certification programs are both for operators who have some experience driving a typical forklift and for individuals with no experience. The real-world training provided by these courses produces graduates who know the safe and proper use of these kinds of equipment.

Telehandler certification programs are offered in two forms: at a training facility; at the job site of the trainee. With the former option, the manufacturer might work along with a licensing agency to bring individuals to a training facility. This option provides trainees with the opportunity to learn to use the machinery in a controlled environment. When completed, participants receive a certification or license to operate this type of machine.

When the training is performed on the worksite, a trained instructor is sent to the work place. This is the best way to make sure that your personnel receive specific training on the machines that they would be working with, helping to train the trainee in their own work environment. Individuals training learn about possible dangerous situations which could occur on the actual work location. The instruction focuses on whatever circumstances that are specific to the work site, enabling operators to be prepared to safely handle these elements.

"Telehandler" is an abbreviated version of the term "telescopic handler," which references the equipment's telescoping or extending arm supporting a fork. The characteristics and controls of the telehandler are somewhat similar to a forklift. A telehandler has the capability of transporting and lifting loads up and away from the vehicle. Improper operation of telehandlers can cause serious accidents. If load limits are exceeded, the machine can tip because of excess weight on the lift. It is an operator's duty to know load limitations and to utilize these machinery safely.

"Conversion" classes are designed for operators who have been certified to use a forklift. These conversion classes would teach the differences between the operation of a forklift and a telehandler, all the while trying to avoid repetitive information that the forklift operator is already familiar with. For trainees who have no prior experience utilizing telehandler machinery, training covers the basic operation and use of the equipment. Some organizations even provide refresher programs.
