

## **Order Picker Training Glendale**

Order Picker Training Glendale - The order picker lift truck enables for people working in a warehouse setting to lift pallets making use of forks. This electronically-powered machinery is also known as a stock picker and is similar to a forklift, allowing for a person to access high up places on a platform. Order pickers are commonly found in warehouse environment and are useful for specialized purposes.

Located close to the floor is the operator platform, which is where the operator can direct the equipment backward, forward or from side to side, and lifts the forks to carry out appropriate level tasks. To get into materials on a high shelf, the platform is raised. The unit has a counterweight on the other end in order to provide balance.

When the materials have been picked, the person is lowered on the platform and the unit is driven to the next site. Some companies have policies against moving the order picker whilst the platform is elevated. Though the unit can be used to place pallets on a shelf, lift trucks and stackers are more frequently used for to stack pallets.

The order picker's battery unit needs to be recharged on a regular basis, something that must be remembered when the unit is employed over multiple shifts. Additional batteries can be bought if the unit is being used during back-to-back shifts.

Before selecting an order picker, it is better to check the battery capacities of the specific models. Different pickers have their own reach limitations and weight limits. Different order picker models have different lift and travel speeds. The fork size likewise differs. Nearly all order pickers have a fork size of around 1.5 m. While higher lift and travel speeds could help increase production, they could also result in more accidents. Operators using order pickers should be well trained on the particular units they would be using.
